## TIMES USED (AND NOT USED) IN THIS PUBLICATION .

The term “Greenwich Mean Time” (GMT) is *not* used in this publication as it is ambiguous and is used, both mistakenly and *wrongly*, in the sense of the Greenwich civil atomic scale, Co-ordinated Universal Time (UTC). From 1675, until the beginning of 1925, Greenwich Mean Time was measured by the Royal Observatory, from GREENWICH MEAN MID-DAY, 12 hours **BEHIND** Universal Time (UT).

For the purposes of lengthy solar observations, the GDSO considers all seven Universal Times (UT0, UT1, UT2, UT0R, UT1R, UT2R and UTC) as being the same. Times in this loose sense are labelled UT. If a stated time in this publication is not labelled at all, then it is to be considered as being UT. In Sections A & B, UT is given to the nearest fifth minute (within the time period of the observations); in Section D, it is given to the nearest minute.

For ‘central meridian’ purposes, the GDSO also considers Terrestrial [Dynamical] Time (TT) as being the same as UT. From July 1997 to December 1998 (inclusive), TT-UTC = +63.1840 seconds; from January 1999 to, at least, December 1999 (inclusive), TT-UTC will equal +64.1840 seconds, these values are approximate equivalents to the amount of time the Earth has lost, as a ‘clock’, since 1900.

As this publication has an international distribution, both New Zealand Standard Time (NZST) [UTC + 12 hours] and New Zealand Daylight Time (NZDT) [UTC + 13 hours] are ignored.

## BILLION.

If the word ‘billion’ is ever used in any GDSO report, it is to be taken in its literal sense of ‘million to the power of two’, that is 1 million million. The value of 1000 million might be occasionally referred to, in the GDSO reports, as the ‘sesquillion’, literally ‘million to the power of one and a half’.

## THE DECIMAL POINT.

**From last issue onwards, the full-stop (.) will be used as the decimal point. The previous practice of using the comma, will cease.**

## PREFACE.

The Sun was observed 167 times in 1998, showing an increase in solar activity, but quite a slow one. The highest number of sunspots was 72 which was reached twice, once in August and again in December. This compares with 62 for the previous year.

The annual observed mean Wolf Number for 1998 was 67.67, compared with 22.96 for 1997. The corrected Wolf Number ( $R_{GD}$ ) for 1998 is 65.44. That for 1997 is 21.52.

Spotless discs accounted for 1.8% of 1998's observations, compared with 20.6% for 1997. All spotless discs appeared in January.

The coming maximum is predicted to be low, at  $110 \pm 20$  in the Wolf Number scale, slightly lower than the previous GDSO prediction. All indices appear to be very low, with the exception of the 2800 MHz solar flux, when compared with the last cycle (No. 22). The corrected Wolf Number ( $R_{GD}$ ), with a 22 month comparison is 49.5% of Cycle 22. Based on 26 months' data, sunspot area is only 39% of last cycle's values. With 31 months' data, the X-ray flares are a mere 20% of that of Cycle 22. At least, the 2800 MHz solar flux has reached 84% of last cycle (26 months' data).

Group complexity ranged from 4.7 in July to 11.5 for May, with an annual mean of 7.3409 for 1998; up from 6.1871 for 1997. There are no comparative figures for Cycle 22.

The number of penumbræ per region is 1.36 for 1998, a 31% increase on 1997, again, no comparative figures for Cycle 22. The number of spots per region for 1998 is 5.98 compared with 5.15 for 1997, a 16% increase. The last smoothed minimum value was 133% of the previous smoothed minimum value, but 31 months into Cycle 23, the tables have turned with the current cycle only 66% of Cycle 22.

2800 MHz solar flux readings show an annual adjusted mean of  $118.0 \times 10^{-22} \text{ W m}^{-2} \text{ Hz}^{-1}$ , compared with 80.9 for 1997. The baseline of these data should be considered as approximately 67.

All these data show that solar activity is on the rise, but at a much slower rate than Cycle 22. Along with the Wolf Number value of  $110 \pm 20$  for maximum, I believe maximum will occur in April 2000  $\pm 3$  months.

The Annual Report for 1999 will be published in April 2000.

## GEÓRGİ TIMOFÉYEVICH DOBROVÓLSKI.

Georgi Dobrovolski (right) was born to Timoféi Dobrovolski and Maria Dobrovólskaya on 1st June 1928, at Odessa, the Ukraine, USSR.

Georgi initially wanted a naval career, but was turned down. He then applied to, and was accepted by, the Air Force. He later joined the cosmonaut corps and became a crew member of Soyúz (Union) 11, with Vladisláv Vólkov and Víktor Patsáyev under his command.

After a successful 23-day stay in space, Georgi along with his colleagues, died just before re-entry into the Earth's atmosphere on the 30th June 1971.

Georgi Timofeyevich left a wife, Lyudmíla, and two daughters, Maria and Natasha, then aged 12 and 4.

above, but  $k = 1$ .

**Micro-hemisphere ( $\mu h$ ):**

This unit of area, equal to 1 000 000th of the visible hemisphere of the Sun, is used in Section C of the report. It is approximately equal to 3 000 000 square kilometres. A small spot's area would be in the vicinity of 5 or 10  $\mu h$ , while a large region's area would be greater than 1000  $\mu h$ . A very large region would have an area greater than 2000  $\mu h$ .

## FORMULÆ.

The following are three formulæ used in the analysis of sunspot data etc.

$\sigma$  (sample standard deviation) is computed as:

$$\sqrt{(\sum x^2 - (\sum x^2)/n) / (n - 1)}$$

The annual  $\sigma$  result is computed from total pool of k values.

$\sigma$  'SIDC' (annual standard deviation based on the SIDC's formula) is computed as:

$$(\sum (\sigma_x \times NOBS)) / \Sigma NOBS$$

$E\sigma$  (estimate of standard deviation) is computed as:

$$\sqrt{\sum (\sigma_x^2 \times NOBS) / \Sigma NOBS}$$

-oOo-

## SMOOTHING FORMULÆ.

The following are the three formulæ used in the smoothing of GDSO sunspot data. All are based on monthly means ( $\bar{x}$ ).

Data suffixed ( $S^{HBm}$ ) are computed as:

$$\left( (\bar{x}_{+3} + \bar{x}_{-3}) + 2(\bar{x}_{+2} + \bar{x}_{-2}) + 3(\bar{x}_{+1} + \bar{x}_{-1}) + 4\bar{x}_0 \right) / 16$$

Data suffixed ( $S^W$ ) are computed as:

$$\left( \sum_{-5}^{+5} \bar{x} + (\bar{x}_{+6} + \bar{x}_{-6})/2 \right) / 12$$

Data suffixed ( $S^{B13}$ ) are computed as:

$$(0.75(\bar{x}_{+6} + \bar{x}_{-6}) + 2(\bar{x}_{+5} + \bar{x}_{-5}) + 3(\bar{x}_{+4} + \bar{x}_{-4}) + 4(\bar{x}_{+3} + \bar{x}_{-3}) + 5(\bar{x}_{+2} + \bar{x}_{-2}) + 6(\bar{x}_{+1} + \bar{x}_{-1}) + 6.5\bar{x}_0) / 48$$

## SUNSPOT MINIMUM — 1996.

Upon the completion of analysis of GDSO data from the 1995-1997 period, a final smoothed minimum of May 1996 has been calculated.

Taking both the Waldmeier and ‘Barnes 13’ smoothing methods as being equally weighted, and the individual corrected smoothed indices (two values for each index) weighted as follows;

WN	PX	BX (x 0.05)	CV	IS (x 3)	$\Sigma w$
1.0	0.9	0.5	0.2	0.1	5.4

we get the following smoothed results for **1996**;

MONTH	arbitrary scale
January	10.12
February	10.04
March	9.98
April	9.14
May	9.08
June	9.80
July	9.88
August	10.14
September	10.64
October	11.48
November	12.42
December	12.92

These results are from unweighted smoothed data of the five indices (two smoothings) that put minimum in April 1996 (6 times), May (3 times) and August (once).

All monthly smoothed data were published in, either, the Annual Reports of 1996 or 1997, or are published in this issue.

WN = Wolf Number ( k in formula neglected ).

TWN = Truncated Wolf Number (Wolf Number minus A and B class regions).

p = Penumbral count for WHOLE solar disc.

s = Penumbra-free spot count for WHOLE solar disc.

## SECTION B

### SUNSPOT REGIONAL BREAKDOWNS.

This section states all regions observed by the GDSO in the format of ;

- \* NOAA / SEC region number ( if known );
- \* co-ordinates of regions in degrees of heliographic latitude ( B )  
[ + if NORTH , - if SOUTH ] , and in degrees of heliographic longitude ( CMD ) in respect to the central meridian [ + if WEST , - if EAST ] . CMD increases with time .
- \* f (spots) , p (penumbræ) , s (outlying spots) and five columns which state the distribution of umbræ within penumbræ (see page B2) ;
- \* GDSO's determination of the McIntosh classifications of each observed region .

The central meridian value (CM) is based on the Carrington system of heliographic longitude.

All regions observed are listed in increasing longitudinal order. East is to the LEFT of North when it comes to co-ordinates on the Sun.

Observations during 1998 are numbered 3375 to 3541 inclusive.

ALL TIMES IN UNIVERSAL TIME (UT).

OBS = Number of GDSO observation.

CM values are stated in degrees.

REG. No are NOAA/SEC region numbers.

B = HELIOGRAPHIC LATITUDE OF REGION ( + IF NORTH, - IF SOUTH ).

CMD = HELIOGRAPHIC DEGREES AWAY FROM THE CENTRAL MERIDIAN ( - IF EAST,  
+ IF WEST ). EAST IS TO THE LEFT OF NORTH.

f = NUMBER OF SUNSPOTS IN REGION.

p = NUMBER OF PENUMBRÆ IN REGION.

s = NUMBER OF PENUMBRAL-FREE SUNSPOTS IN REGION.

gr = NUMBER OF MULTI-SPOT GROUPS ( in individual lines, single spot regions = 0,  
multi-spot regions = 1 ).

grfp = NUMBER OF UMBRÆ WITHIN PENUMBRÆ WITHIN THE GROUPS gr.

grf = NUMBER OF NON-PENUMBRAL SPOTS WITHIN THE GROUPS gr.

efp = NUMBER OF SINGLE PENUMBRAL SPOTS.

ef = NUMBER OF SINGLE NON-PENUMBRAL SPOTS.

LETTERS IN 'CLASS' COLUMN ARE McINTOSH CLASSIFICATIONS DETERMINED  
BY THE GDSO.

BRUNNER (SINGLE LETTER 'ZURICH') CLASSIFICATIONS ARE THE SAME AS THE  
INITIAL McINTOSH CLASS LETTER, EXCEPT THE FOLLOWING:

E?O, F?O = G; and HAX, HRX & HSX = J.

gr + efp + ef = g.

grfp + grf + efp + ef = f.

grf + ef = s.

## SECTION D

### MAJOR SOLAR FLARE TIMINGS .

In this section, data on flares are given in the format of beginning, maximum and ending times, along with the flares' x-ray strengths (in microWatts per square metre). This report deals with 1998's flares.

Flares with a strength of less than 1 microWatt per square metre are not stated.

Analysis of these flare data appears on pages D11 and D12 of this report.

## MAJOR SOLAR FLARES for 1998.

ALL TIMES IN UNIVERSAL TIME (UT).

Times are as at the Earth, the flares actually occurred 8 minutes earlier than the stated times. Data were collected through the US NOAA from a 24-hour satellite watch over the year concerned.

Strength of the flares are stated in microWatts per square metre ( $\mu\text{W m}^{-2}$ ).

If any flares are not  $\geq 1 \mu\text{W m}^{-2}$  in strength, then they are not listed. If the strength of a flare is not known (by the GDSO), or if the strength is questionable, it is also not listed.

If no major flares ( $\geq 1 \mu\text{W m}^{-2}$ ) are observed on any particular day, then the date is left out of the list.

- ◆ A in time columns means the flare continued *after* the end of the observation.
- ◆ B in time columns means the flare started *before* the observation began.
- ◆ OA after maximum time column means the maximum was that time *or after*. This occurs only when the ending time is suffixed with an A and that that time is the same as the maximum time.
- ◆ OB after the maximum time column means the maximum was that time *or before*. This occurs only when the beginning time is suffixed with a B and that that time is the same as the maximum time.
- ◆ U in time columns means ‘uncertain’.

If times go beyond 24 hours UT, then 0015 is stated as 2415, etc.

## X-RAY FLARE ANALYSIS, 1997 - 1998.

The following is an analysis of solar x-ray flares showing monthly values of 'mean daily output' (MDO), 'mean x-ray strength' (MXS), and 'mean daily mean' (MDM), all expressed in microWatts / square metre.

All data are based on US NOAA satellite data.

d = number of days of data.

n = number of events.

TABLE W3:  
CORRECTED WOLF NUMBERS for 1997 - 1998.

As the GDSO is in suburban Auckland, it can suffer terrible atmospheric conditions, hence the ‘observed’ Wolf Numbers have to be upgraded to give reflections of international results. International Wolf Number results are computed by the Sunspot Index Data Centre, at the Observatoire Royal de Belgique, Bruxelles, Belgium.

Below are the ‘observed’ Wolf Numbers along with the monthly k co-efficients and the corrected values ( $R_{GD}$ ) for 1997 - 1998. The SIDC’s final values ( $R_I$ ) are also stated.

$I/GDSO = \text{SIDC's mean (of days observed by the GDSO) divided by the GDSO's monthly mean.}$   
 $I/GDSO_A = \text{SIDC's mean (of days with GDSO k values) divided by the GDSO's observed mean for the same days.}$

$n = \text{number of GDSO observations.}$

$n_k = \text{number of k values.}$

$\sigma = \text{sample standard deviation of k values.}$

$\sigma^{\text{'SIDC'}} = \text{annual } \sigma \text{ computed on the SIDC formula.}$

TABLE W4:  
CORRECTED **WOLF NUMBERS** for Rotations 1917 - 1943.

As a k value is attributed to each spotted observation, the k value for any specific rotation is the mean of all the k values for the rotation concerned.

The corrected values are labelled  $R_{GD}$ .

$R_{GD} = WN \times k$ .

$\sigma$  = sample standard deviation of k values.

$I/GDSO$  = International mean (of days observed by the GDSO) divided by the GDSO's rotation mean.

$I/GDSO_A$  = International mean (of days observed by the GDSO) divided by the GDSO's observed mean for the *same* days.

n = number of GDSO observations.

$n_k$  = number of k values.

NB: WN(S<sup>HBm</sup>), WN(S<sup>W</sup>) & WN(S<sup>B13</sup>) quarterly values are means of 3 monthly values.

WN(S<sup>HBm</sup>), WN(S<sup>W</sup>) & WN(S<sup>B13</sup>) yearly values are means of 12 monthly values.

R<sub>GD</sub> quarterly values are computed as quarterly WN means multiplied by quarterly k means.

Annual values of R<sub>GD</sub> are annual Wolf Number means multiplied by annual k means.

TABLE G3:  
CORRECTED ACTIVE AREA (g) VALUES for 1997 - 1998.

As the GDSO is in suburban Auckland, it can suffer terrible atmospheric conditions, hence the ‘observed’ Active Area means have to be upgraded to give reflections of international results. International Active Area results are computed by the Solar Section of the British Astronomical Association. Below are the ‘observed’ Active Area (g) means along with the monthly k co-efficients and the corrected values ( $g_{GD}$ ) for 1997 - 1998. The BAA’s final values ( $g_B$ ) are also stated.

$I/GDSO =$  BAA’s mean (of days observed by the GDSO) divided by the GDSO’s monthly mean.

$I/GDSO_A =$  BAA’s mean (of days with GDSO k values) divided by the GDSO’s observed mean for the *same* days.

n = number of GDSO observations.

$n_k$  = number of k values.

$\sigma$  = sample standard deviation of k values.

$\sigma$ ‘SIDC’ = annual  $\sigma$  computed on the SIDC formula.

$E\sigma$  = annual estimate of standard deviation.

TABLE G4:  
CORRECTED ACTIVE AREA (**g**) VALUES for Rotations 1917 - 1943.

As a k value is attributed to each spotted observation, the k value for any specific rotation is the mean of all the k values for the rotation concerned.

The corrected values are labelled  $g_{GD}$ .

$g_{GD} = g \times k$ .

$\sigma$  = sample standard deviation of k values.

I/GDSO = International mean (of days observed by the GDSO) divided by the GDSO's rotation mean.

I/GDSO<sub>A</sub> = International mean (of days observed by the GDSO) divided by the GDSO's observed mean for the *same* days.

n = number of GDSO observations.

$n_k$  = number of k values.

TABLE P3:  
CORRECTED PETTISINDICES for 1997 - 1998.

As the GDSO is in suburban Auckland, it can suffer terrible atmospheric conditions, hence the ‘observed’ Pettisindices have to be upgraded to give reflections of international results. International Pettisindex results are computed by Siegfried Gonzi, St Paul, Austria, on behalf of Sonne, Germany.

Below are the ‘observed’ Pettisindices along with the monthly k co-efficients and the corrected values ( $PX_{GD}$ ) for 1997 - 1998. Sonne’s final values ( $PX_I$ ) are also stated.

$I/GDSO =$  Sonne’s mean (of days observed by the GDSO) divided by the GDSO’s monthly mean.

$I/GDSO_A =$  Sonne’s mean (of days with GDSO k values) divided by the GDSO’s observed mean for the *same* days.

n = number of GDSO observations.

$n_k$  = number of k values.

$\sigma$  = sample standard deviation of k values.

$\sigma$ ‘SIDC’ = annual  $\sigma$  computed on the SIDC formula.

TABLE P4:  
CORRECTED **PETTISINDICES** for Rotations 1917 - 1943.

As a k value is attributed to each spotted observation, the k value for any specific rotation is the mean of all the k values for the rotation concerned.

The corrected values are labelled  $\text{PX}_{\text{GD}}$ .

$$\text{PX}_{\text{GD}} = \text{SN} \times k.$$

$\sigma$  = sample standard deviation of k values.

$I/\text{GDSO}$  = International mean (of days observed by the GDSO) divided by the GDSO's rotation mean.

$I/\text{GDSO}_A$  = International mean (of days observed by the GDSO) divided by the GDSO's observed mean for the *same* days.

n = number of GDSO observations.

$n_k$  = number of k values.

SN(S<sup>HBm</sup>), SN(S<sup>W</sup>) & SN(S<sup>B13</sup>) yearly values are means of 12 monthly values.

PX<sub>GD</sub> quarterly values are computed as quarterly SN means multiplied by quarterly k means.

Annual values of PX<sub>GD</sub> are annual Pettisindex means multiplied by annual k means.

TABLE B3:  
CORRECTED BECKINDICES for 1997 - 1998.

As the GDSO is in suburban Auckland, it can suffer terrible atmospheric conditions, hence the ‘observed’ Beckindices have to be upgraded to give reflections of international results. International Beckindex results are computed by Sonne, Germany.

Below are the ‘observed’ Beckindices along with the monthly k co-efficients and the corrected values ( $BX_{GD}$ ) for 1997 - 1998. Sonne’s final values ( $BX_I$ ) are also stated.

$I/GDSO$  = Sonne’s mean (of days observed by the GDSO) divided by the GDSO’s monthly mean.

$I/GDSO_A$  = Sonne’s mean (of days with GDSO k values) divided by the GDSO’s observed mean for the *same* days.

$n$  = number of GDSO observations.

$n_k$  = number of k values.

$\sigma$  = sample standard deviation of k values.

$\sigma$ ‘SIDC’ = annual  $\sigma$  computed on the SIDC formula.

TABLE B4:  
CORRECTED **BECKINDICES** for Rotations 1917 - 1943.

As a k value is attributed to each spotted observation, the k value for any specific rotation is the mean of all the k values for the rotation concerned.

The corrected values are labelled  $BX_{GD}$ .

$BX_{GD} = BX \times k$ .

$\sigma$  = sample standard deviation of k values.

$I/GDSO$  = International mean (of days observed by the GDSO) divided by the GDSO's rotation mean.

$I/GDSO_A$  = International mean (of days observed by the GDSO) divided by the GDSO's observed mean for the *same* days.

n = number of GDSO observations.

$n_k$  = number of k values.

TABLE C3:  
CORRECTED CLASSIFICATION VALUES for 1997 - 1998.

As the GDSO is in suburban Auckland, it can suffer terrible atmospheric conditions, hence the ‘observed’ Classification Values have to be upgraded to give reflections of international results. International Classification Value results are computed by Kjell Inge Malde, of Norway.

Below are the ‘observed’ Classification Values along with the monthly k co-efficients and the corrected values ( $CV_{GD}$ ) for 1997 - 1998. Norway’s final values ( $CV_I$ ) are also stated.

$I/GDSO$  = Norway’s mean (of days observed by the GDSO) divided by the GDSO’s monthly mean.

$I/GDSO_A$  = Norway’s mean (of days with GDSO k values) divided by the GDSO’s observed mean for the same days.

n = number of GDSO observations.

$n_k$  = number of k values.

$\sigma$  = sample standard deviation of k values.

$\sigma^{‘SIDC’}$  = annual  $\sigma$  computed on the SIDC formula.

$E\sigma$  = annual estimate of standard deviation.

TABLE C4:  
CORRECTED CLASSIFICATION VALUES for Rotations 1917 - 1943.

As a k value is attributed to each spotted observation, the k value for any specific rotation is the mean of all the k values for the rotation concerned.

The corrected values are labelled  $CV_{GD}$ .

$CV_{GD} = CV \times k$ .

$\sigma$  = sample standard deviation of k values.

I/GDSO = International mean (of days observed by the GDSO) divided by the GDSO's rotation mean.

I/GDSO<sub>A</sub> = International mean (of days observed by the GDSO) divided by the GDSO's observed mean for the *same* days.

n = number of GDSO observations.

$n_k$  = number of k values.

TABLE I-3:  
CORRECTED INTER-SOL INDICES for 1997 - 1998.

As the GDSO is in suburban Auckland, it can suffer terrible atmospheric conditions, hence the ‘observed’ Inter-Sol Indices have to be upgraded to give reflections of international results. International Inter-Sol Index results are computed by Paderborn Public Observatory, Germany.

Below are the ‘observed’ Inter-Sol Indices along with the monthly k co-efficients and the corrected values ( $IS_{GD}$ ) for 1997 - 1998. Paderborn’s final values ( $IS_I$ ) are also stated.

$I/GDSO$  = Paderborn’s mean (of days observed by the GDSO) divided by the GDSO’s monthly mean.

$I/GDSO_A$  = Paderborn’s mean (of days with GDSO k values) divided by the GDSO’s observed mean for the *same* days.

n = number of GDSO observations.

$n_k$  = number of k values.

$\sigma$  = sample standard deviation of k values.

$\sigma$ ‘SIDC’ = annual s computed on the SIDC formula.

$E\sigma$  = annual estimate of standard deviation.

TABLE I-4:  
CORRECTED **INTER-SOL INDICES** for Rotations 1916 - 1943.

As a k value is attributed to each spotted observation, the k value for any specific rotation is the mean of all the k values for the rotation concerned.

The corrected values are labelled IS<sub>GD</sub>.

$$\text{IS}_{\text{GD}} = \text{IS} \times k.$$

$\sigma$  = sample standard deviation of k values.

I/GDSO = International mean (of days observed by the GDSO) divided by the GDSO's rotation mean.

I/GDSO<sub>A</sub> = International mean (of days observed by the GDSO) divided by the GDSO's observed mean for the *same* days.

n = number of GDSO observations.

n<sub>k</sub> = number of k values.

PENUMBRA/GROUP MEANS 1997 - 1998.

The following  $\bar{p}/\bar{g}$  data are obtained by averaging each p/g value from every observation within the period concerned, ie. the number of penumbræ per group per observation.

The  $\bar{p}/\bar{g}$  data are obtained by dividing the total number of penumbræ by the total number of groups within the period concerned, ie. the number of penumbræ per group, the true arithmetical mean.

$\sigma$  values are sample standard deviations.

TABLE M9C:  
GROUP COMPLEXITY INDICES 1997 - 1998.

The Group Complexity Index (GCI) is an index for showing how complex sunspot groups can get throughout the sunspot cycle. It is not an activity index like the Wolf Number etc.

The GCI is computed as  $(\bar{p}+\bar{f})/\bar{g}$  as long as there is the same number of observations for each component, as well as the same observations for each component, whatever period is concerned. If the three components are not common to all observations, then incomplete observations are ignored.

The minimum GCI value is 1 (spotless observations do not count), and the approximate maximum value is about 20.

$\Sigma g$  = number of regions observed.

n = number of observations.

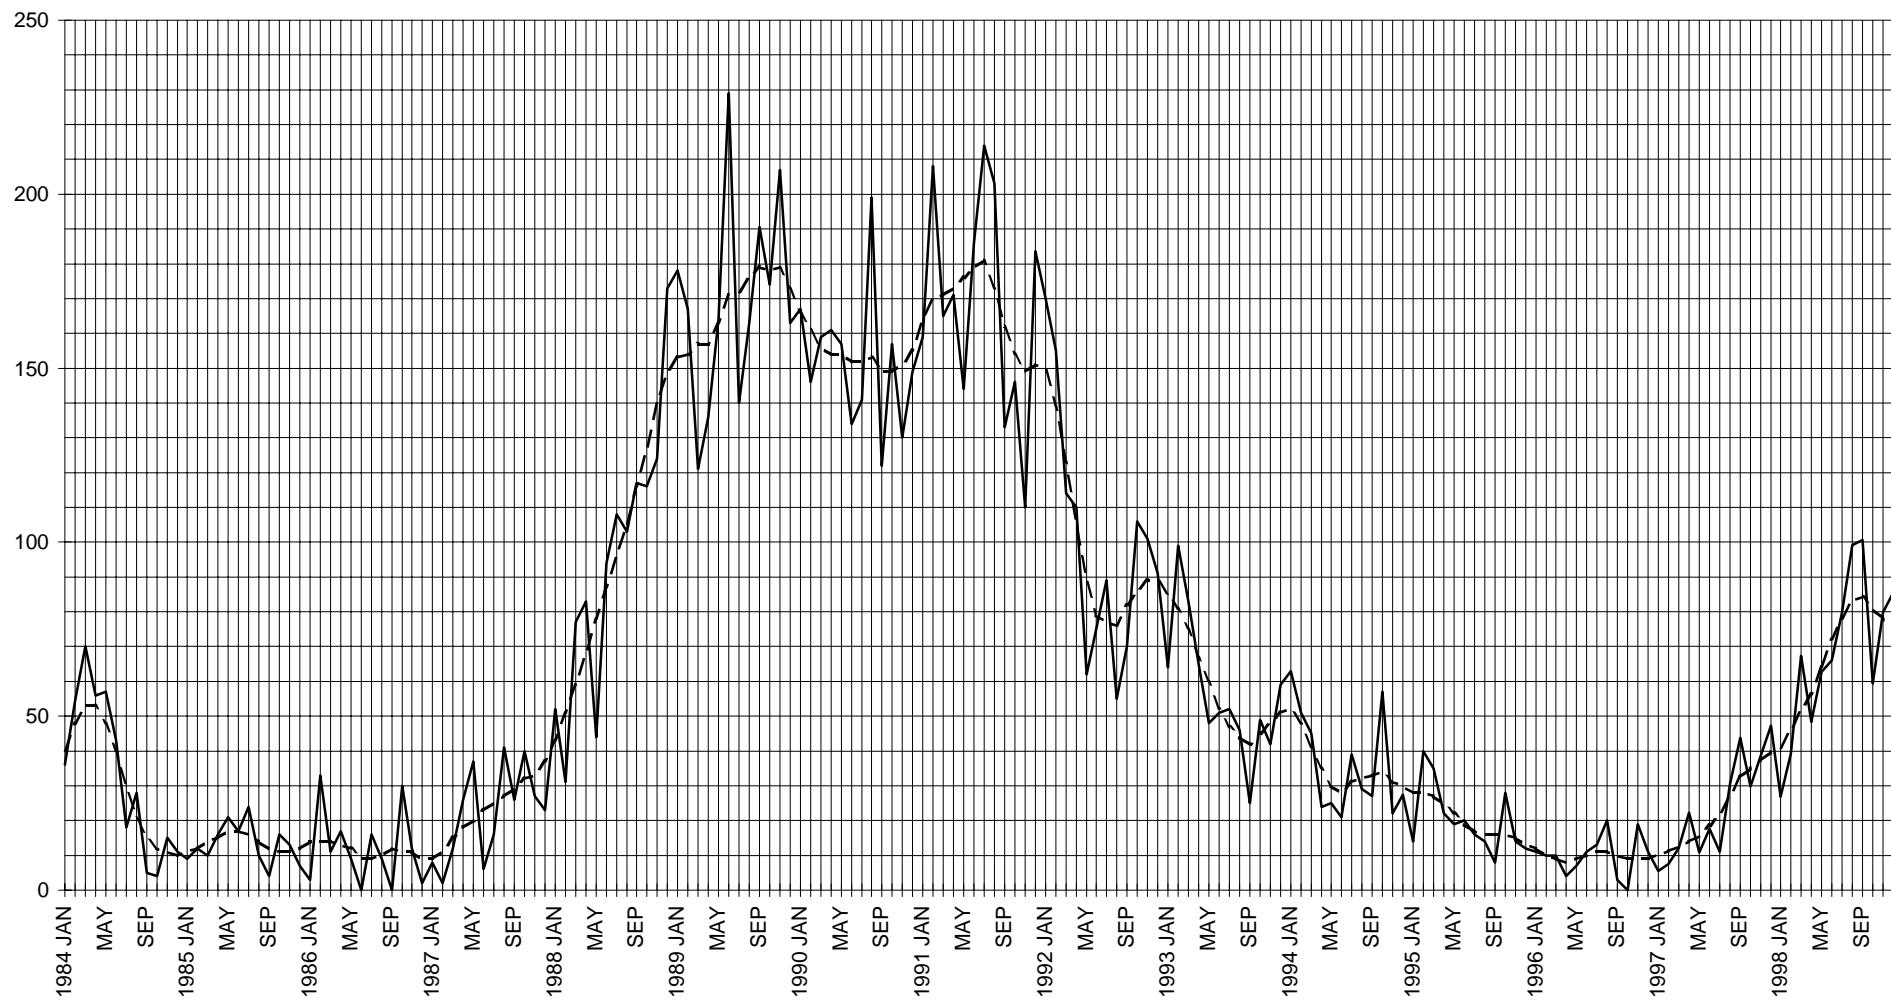

OWS = observations *with* sunspots.
